<p>1.1 Claim 1: The present application shows a stack of support plates for reception and cryopreservation of a multiplicity of samples. The support plates have a compartmental arrangement with a plurality of sample reservoirs and are connected by an anchor pin through a bearing bore in the plates such that a support plate can swivel about the anchor pin to swing out from the stack. The prior art discloses support plates for cryopreservation that take a CD form and thus can be stacked (see in D1 the description of the prior art and figures 12 and 13). However, CD supports of this kind are not swivelled out for examination but rather must be removed from the stack individually by means of</p>

automated processes. The present application solves the problem of making available a stack of supports for cryopreservation on which a plurality of samples are deposited such that any given samples on the support plate can be controlled in a simple manner.

D2 discloses petri dishes arranged to pivot about a pin so as to provide simple and rapid access to the sample. A Petri dish does not have a compartmental arrangement with a plurality of sample reservoirs and is designed for only one sample. It is therefore necessary to provide the dish with an articulated projection so as not to alter the view of the sample chamber. This is not necessary in the present application. Hence, it is not obvious to combine the teachings of D1 and D2, and so the subject matter of claim 1 involves an inventive step within the meaning of PCT Article 33(3).

- 1.2 The same is true for independent method claim 22 and use claim 26, though it should be noted that claim 26 should be limited to cryopreservation.
